TUI

THE STRATEGIC EVOLUTION OF

CUSTOMER ACCOUNT

BUILDING THE TRUSTED RELATIONSHIP PLATFORM
FOR THE AI-DRIVEN TRAVEL FUTURE

From login.
To loyalty.
To lifelong journeys.

A strategic whitepaper on how TUI's Customer Account evolves from operational capability to the trusted relationship platform that powers personalisation, loyalty and AI-driven experiences across every journey.

IDENTITY
A single, global identity across every touchpoint.

PREFERENCES
Declared travel preferences that create real value.

CONTEXT
Trip-spanning context that enables relevance.

LOYALTY
Rewarding the relationship, not just the trip.

AI EXPERIENCES
Intelligent, trusted experiences in every journey phase.

A STRATEGIC WHITEPAPER FOR TODAY'S DECISIONS
AND TOMORROW'S RELATIONSHIP.

FY27–FY30 AND BEYOND

"Every decade, the digital relationship between companies and customers is redefined. The next transformation has already begun."

Preface — Why I Wrote This

Group Customer Account did something remarkable: it took a fragmented mess of market-specific login systems and turned it into a single global platform. That was the hard part — and it's done. But somewhere along the way, the conversation about what comes *next* never really happened. We kept treating Customer Account as plumbing. Login, profile, bookings. Maintain it, keep it running, move on.

I wrote this because I think that's a mistake — and the timing makes it urgent.

AI is reshaping how people discover and plan travel. Customers are starting their journey in places we don't own: asking ChatGPT for destination ideas, letting an agent compare options, describing what they want in natural language instead of filling in search forms. The top of the funnel is leaving us. And when inventory becomes accessible to any agent through open protocols, the only thing that stays defensible is the *relationship* — the trusted understanding of who the customer is, what they want, and what they've told us in confidence.

That relationship lives in Customer Account. Identity, consent, preferences, history. It's the one thing an external agent can't replicate, and it's the foundation the Concierge vision needs to become real. But none of that value is unlocked automatically. It requires a deliberate shift — from maintaining an operational system to building a strategic platform.

This document is my attempt to articulate that shift: what the opportunity is, why the window is now, and what we should do about it. It's written for the people who can decide to act on it.

— Albin Malmgren, Digital Product Manager — TUI Sales Solutions, July 2026

Executive Summary

Customer Account has been treated as plumbing — login, profile, bookings. This document argues it is becoming TUI's most important digital relationship asset, and that the AI era makes that shift urgent rather than optional.

The defensible advantage. TUI is vertically integrated: unlike a pure marketplace, TUI goes with the customer through travel and stay. The relationship does not end at checkout. No external agent or aggregator can replicate a trusted, trip-spanning companion that knows the customer from inspiration through in-resort and back. Customer Account is where that relationship lives — identity, consent, context, and preferences that every future experience draws upon.

Why now. Three forces converge. Discovery is migrating to AI channels TUI does not own, while only 38% of customers rebook within two years — meaning the relationship, not the landing page, is what brings them back. Inventory is commoditising as open protocols (Google UCP, OpenAI ACP, Expedia's MCP server) let any agent reach any supplier's stock; what remains defensible is the trusted, consented understanding of the individual customer, which is exactly what Customer Account holds. And TUI has already done the hard part: Group Customer Account established a global identity platform. The foundation exists; the task is to unlock its value.

The strategic shift. Customer Account evolves from an *operational capability* — login, profile, bookings — into a *trusted relationship platform*: identity, consent, context, and preferences that every future experience draws upon, from the Concierge vision to loyalty to personalisation to agent-mediated booking.

The operating principle.

> Customer Account *enables*; it does not *own*. Customer understanding is produced once and consumed many times.

The first bets. The strategy begins with two moves that prove the platform posture: a declared Travel Preferences capability with genuine value exchange, consumed in at least one live journey beyond myTUI, and reusable Profile and Preference APIs that make customer understanding available across the business. Both are measured by reuse and by relevance lift over generic experiences — evidence that the platform model creates value, not just capability.

The value at stake. The 3-Year Plan targets stretching double-digit growth in active accounts: from 17m (FY26) to 19m (FY27) to 21m (FY28) on the 2-year active measure, with Annual Active Users (1-year active) growing from 13m to 16m over the same period. At a 38% two-year rebooking rate, a 1-point improvement represents approximately 170,000 incremental repeat bookings. At an average booking value of ~€3,500, that is ~€595m incremental revenue per retention point — before accounting for the lower acquisition cost of a returning customer. App-channel shift is worth ~€1m per point from online and ~€8.7m per point from retail. Context-driven ancillary attach improvement of 2–3 points on a base of ~50% represents tens of millions in direct margin. These are conservative, caveated ranges — but they frame why the relationship platform is a multi-hundred-million-euro opportunity, not a features backlog.

The sequence. Resolution → Reuse → Companion → Relationship Platform. Each horizon builds on the last. Nothing requires replacing the platform.

The ask. This strategy requests a named executive sponsor within Group Customer Account and Sales Solutions leadership, cross-organisational commitment to identity resolution as a funded FY27 priority, and alignment on the first consuming journey for declared preferences by end of Q1 FY27. The specific mobilisation is described in the closing chapter.

PART I — Industry & Strategic Context

Why is Customer Account changing? The external forces reshaping digital travel, and why a trusted, authenticated relationship — rather than any single interface — is becoming the strategic asset.

Chapter 1 — The Evolution of Digital Customer Relationships

Executive Summary

Customer Account has traditionally been a supporting capability: authentication, profile management, access to bookings. TUI has already transformed it from fragmented market-specific solutions into a global platform through Group Customer Account. That was the hardest phase — and it is done. The strategic challenge is no longer how to *build* Customer Account. It is how to *maximise its value* — and in doing so, to protect and extend the one advantage no marketplace or AI intermediary can replicate: the trusted, trip-spanning relationship that only a vertically integrated travel company can offer.

1.1 Three generations of digital commerce

Every major shift in digital commerce has changed how organisations build customer relationships. The first generation was about **availability**: getting products online, with success measured in visitors, page views, and bookings. The second was about **optimisation**: conversion-rate optimisation, responsive design, mobile apps, personalisation, and experimentation — making individual journeys better, one at a time.

The third generation, now underway, is about the **relationship** itself. Customers increasingly expect organisations to recognise them across channels, remember previous interactions, understand their preferences, and provide relevant experiences without asking the same questions repeatedly. Competitive advantage is moving from the quality of individual touchpoints to the quality of the relationship that connects them.

1.2 TUI's position — and its unique advantage

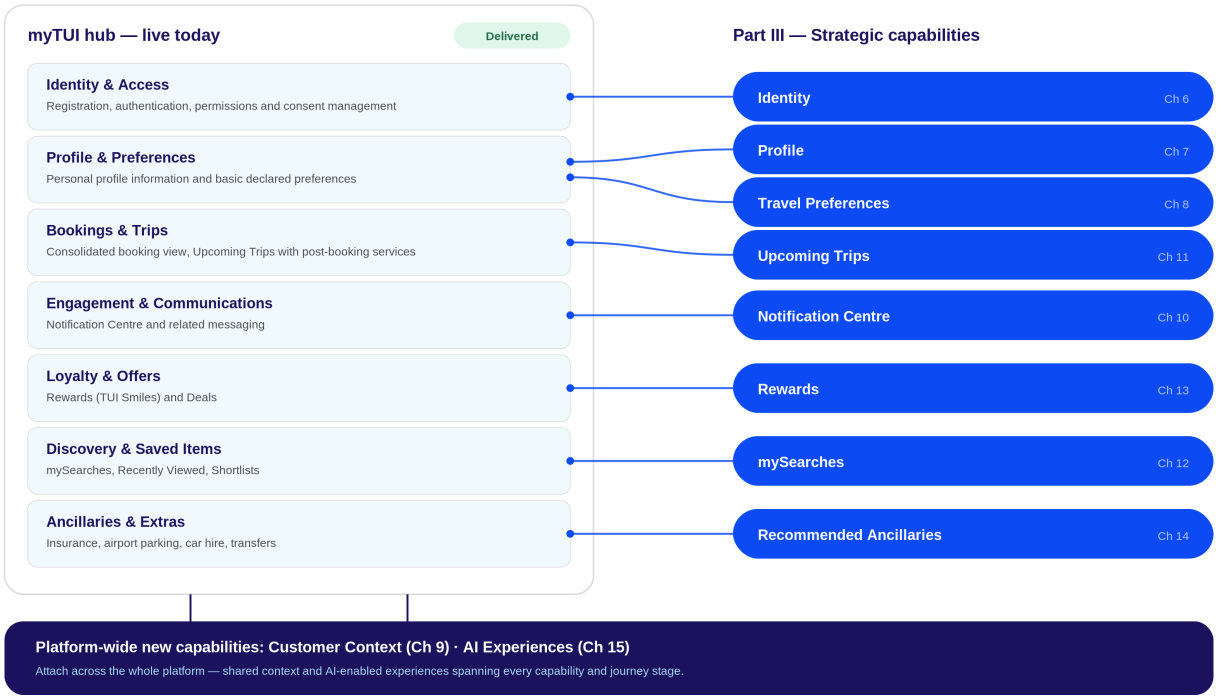

Unlike many competitors still fragmented across brands and markets, TUI already operates a global Customer Account platform. Authentication, registration, profile management, and booking access are delivered through a common capability serving multiple markets. Group Customer Account solved a *technology* problem — fragmentation. The next phase solves a *business* problem: how to leverage that platform to strengthen relationships, deepen loyalty, improve personalisation, and support AI-enabled experiences.

But TUI's position is stronger than just having a platform. TUI is vertically integrated — it owns hotels, operates cruises, charters aircraft, and delivers experiences in-resort. Unlike Expedia or Booking.com, the relationship does not end at checkout. TUI travels *with* the customer. This means Customer Account can span the entire trip — from inspiration through booking, preparation, travel, in-resort, and return. No pure marketplace can offer this continuity, and no external AI agent can replicate it. This is TUI's most defensible structural advantage, and Customer Account is where it is expressed.

The strategic question is therefore not "how do we build this?" but "how do we extract maximum value from what already exists — and from the unique structural advantage TUI holds?" The answer emerges through the coordinated evolution of the capabilities described in Part III.

Figure 1.1 — Current myTUI Capability Landscape

The capabilities live today through Group Customer Account, and where the strategic capabilities of Part III attach.

Key Takeaways

- TUI has completed the hardest phase through Group Customer Account.
- The challenge shifts from platform consolidation to value extraction.
- TUI's vertical integration — owning the trip end-to-end — is the structural advantage that makes this strategy uniquely powerful; no marketplace or AI intermediary can replicate a relationship that spans travel and stay.
- Customer Account should evolve from operational capability to trusted digital relationship — not a destination in the journey, but the foundation connecting every stage of it.

Chapter 2 — Why Customer Account Matters More Than Ever

Executive Summary

Acquisition costs are rising, privacy regulation is tightening, and personalisation is becoming enterprise-wide. Each trend independently increases the value of an authenticated, permission-based relationship — and Customer Account is where that relationship lives. The strategic shift this chapter argues for is a change of posture: from feature owner within myTUI to platform enabler for the whole customer journey.

2.1 The economics are shifting

Digital travel has historically optimised around acquisition — SEO, paid search, affiliates. That model is becoming structurally more expensive for three reinforcing reasons.

First, **privacy regulation is tightening across TUI's European markets.** GDPR enforcement is intensifying, the ePrivacy Regulation is advancing, and platform-level signal loss (Apple's ATT, browser restrictions on cross-site tracking) has already degraded the effectiveness of third-party audience targeting — regardless of any

single browser vendor's deprecation timeline. The structural direction is clear: organisations holding trusted, first-party, consented relationships are advantaged over those relying on anonymous behavioural tracking.

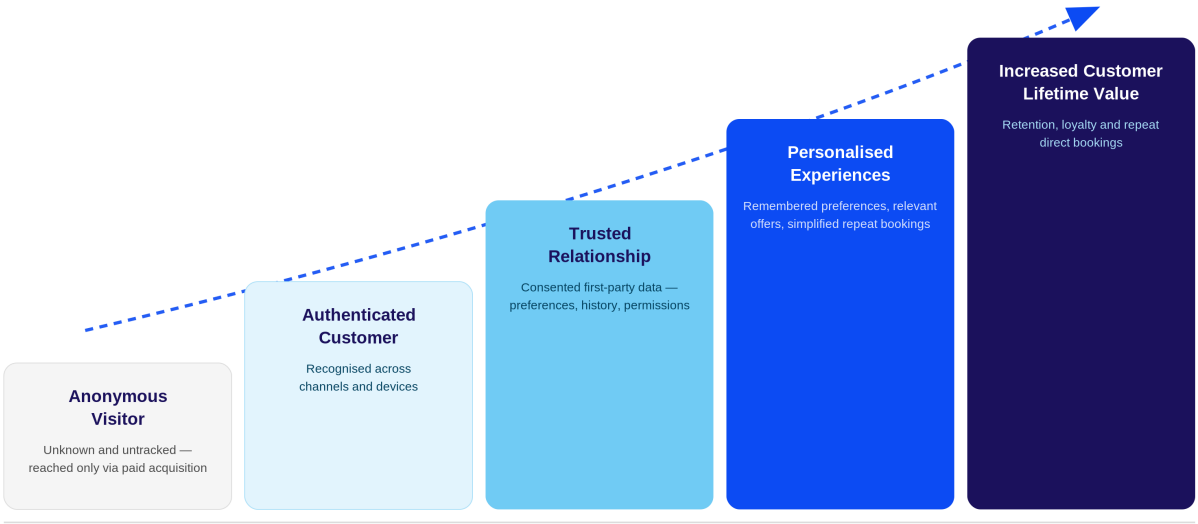

Second, **platform signal loss compounds acquisition cost.** As targeting signals degrade, paid-acquisition efficiency falls. Customer acquisition cost rises, making retention proportionally more valuable. TUI already holds millions of authenticated relationships through Group Customer Account — a long-term strategic asset whose value extends far beyond authentication.

Third, **AI channels fragment discovery.** As discovery moves to conversational and agentic interfaces (Chapter 3), the traditional funnel — SEO landing page to booking — is disrupted. Personalisation and re-engagement through owned, consented relationships become the primary mechanism for bringing customers back to book directly.

A sign-in by itself creates little value. The value emerges from what recognition enables: remembered preferences, relevant post-booking services, simplified repeat bookings, consistent cross-channel experiences, and communication tied to real interests rather than campaign calendars.

Figure 2.1 — The Value of an Authenticated Relationship

A sign-in by itself creates little value — the value emerges from what recognition enables, layer by layer.

Each layer builds on the previous — value compounds as trust, consent and data deepen.

2.2 Customer Account beyond myTUI

The most important strategic shift is that Customer Account should extend beyond the myTUI destination and become a reusable capability supporting the entire customer journey:

Journey Stage	Opportunity Enabled by Customer Account
Homepage	Personalised inspiration from travel history and preferences
Search	Relevant default filters, airports, destinations
Hotel Details	Context-aware recommendations
Booking	Reduced form completion, personalised options
Upcoming Trips	Dynamic recommendations by booking stage
Customer Service	Shared context across support channels

Journey Stage	Opportunity Enabled by Customer Account
Notifications	Updates linked to interests and active bookings
In-Resort	Companion experiences, excursion recommendations, real-time support

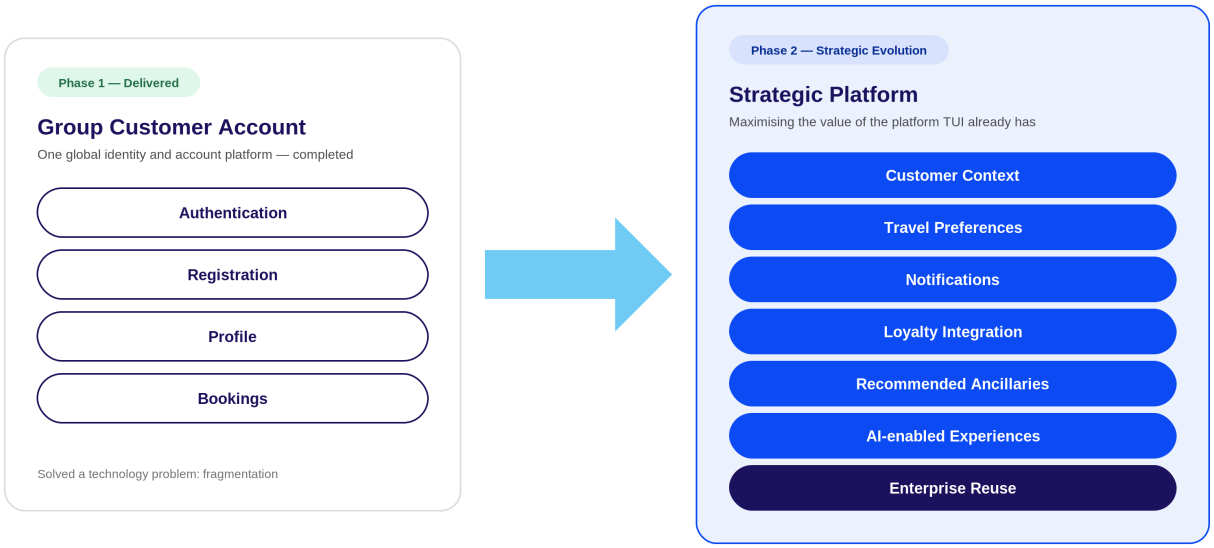

As this happens, Customer Account becomes *less visible* while simultaneously becoming *more valuable*. And the last row — in-resort — is what only TUI can deliver. A marketplace's relationship ends at checkout; TUI's relationship deepens during the trip itself.

2.3 From feature owner to platform enabler

Rather than asking "what additional features should Customer Account build?", the more productive question is "how can more of TUI benefit from capabilities Customer Account already provides?" This reframing — from feature owner to platform enabler — is the posture the entire strategy builds on, and it is formalised as the operating model in Part III. None of it requires replacing the current platform.

Figure 2.2 — From Group Customer Account to Strategic Platform

From feature owner within myTUI to platform enabler for the whole customer journey — on the platform TUI already has.

Same platform, no replacement — Phase 2 solves a business problem: extracting value from what Phase 1 built.

Key Takeaways

- Every major trend — privacy regulation, platform signal loss, AI channel fragmentation — increases the value of the authenticated relationship.
- Customer Account should extend beyond myTUI into a reusable capability consumed across the journey — including in-resort, where only TUI can go.
- The shift is from feature owner to platform enabler, on the platform TUI already has.

Chapter 3 — Why Now: The Shift That Makes Customer Account Strategic

Executive Summary

As AI becomes how customers discover and plan travel, three things happen at once: discovery moves away from TUI's own channels, inventory commoditises through open protocols, and trust at the moment of decision stays with brands customers already know. Competitive advantage shifts from owning the interface to owning the relationship. That is the business Customer Account is in — and TUI's vertical integration makes the relationship uniquely rich.

3.1 Discovery is leaving our own channels

For two decades the customer journey began where TUI could influence it: a search engine, an ad, a landing page. That starting point is moving. Industry research through 2026 shows a large and growing share of travellers beginning with AI assistants — describing what they want in natural language rather than typing keywords into a search box. TUI's own Sales Solutions strategy notes that 40–45% of customers already use AI to research travel plans, with 8–15% willing to book within agentic channels within three years.

The consistent finding across this research is a split between discovery and transaction. The shift is real at *discovery* but far slower at *booking*: only a small minority of travellers will let an AI agent complete a trip, and most still prefer trusted brands for the transaction itself. Expedia named this the "AI trust gap" in 2026. The timing insight matters strategically: the top of the funnel is migrating to channels TUI does not own, but the moment of commitment has not migrated with it. What TUI can still own is the relationship that determines whether the customer comes back to book — and that relationship is established in the account.

TUI's own position in AI-driven discovery is not yet verified to a standard this document should assert; the strategy therefore recommends instrumenting LLM share of voice as an owned, per-market metric (Chapter 22) rather than relying on a directional read. Whether TUI leads or trails, the argument in this chapter holds.

3.2 The product is becoming a commodity

Open standards emerged through 2026 that let AI agents reach a supplier's inventory directly — Google's Universal Commerce Protocol, OpenAI's Agentic Commerce Protocol, and rapid MCP adoption. Expedia is opening its inventory to external agents while trying to keep travellers on its own platforms.

The risk, stated plainly: by exposing inventory to agents, a supplier risks becoming an invisible inventory provider sitting behind other interfaces. If the only thing on offer is stock, the competition is on price alone. What stays defensible is the trusted, consented understanding of the individual customer, and the relationship that spans their entire trip. That is not inventory — and it is exactly what Customer Account holds.

3.3 The trusted, trip-spanning relationship — TUI's structural moat

An outside agent can infer behaviour from fragments. What it cannot do is act on what the customer has *deliberately entrusted to TUI* — declared preferences, consent, travel history, companions, loyalty status — and it cannot be present *during the trip itself*.

This is the one thing only TUI can say. TUI's vertical integration makes this decisive: unlike a pure marketplace, TUI goes with the customer through travel and stay. TUI owns the hotels, operates the cruises, charters the aircraft, delivers the excursions. The relationship does not end at checkout — it deepens during the trip. An Expedia or Booking.com hands the customer off to a third-party hotel operator; TUI *is* the operator.

Customer Account is where identity is established, consent is granted, preferences are captured, and the memory of the relationship accumulates. In an AI era these are not account-management features. They are the

raw material of the only advantage that survives commoditisation — an asymmetry of actionability that an intermediary cannot replicate, extended across the entire trip by TUI's ownership of the in-resort experience.

3.4 Why now specifically

Three reasons the window is open today rather than eventually. First, TUI has already done the hardest part: Group Customer Account established the foundation the AI era demands. Second, the standards that will govern identity, consent, and agent delegation are being set through 2026, and regulation across TUI's European markets is pushing in the same direction — waiting means conceding the relationship layer while it is still winnable. Third, this is the missing piece in TUI's wider strategy: the Sales Solutions vision describes the TUI Concierge — a smart, trusted, always-on companion — but does not fully answer where that intelligence comes from. The answer is Customer Account — the identity, consent, and context platform that makes a trusted companion possible.

Key Takeaways

- The AI shift moves advantage from owning the interface to owning the relationship.
- Discovery migrates to AI channels; booking and trust stay with known brands.
- Open protocols commoditise inventory; the trusted, trip-spanning relationship survives.
- TUI's vertical integration is the structural moat — only TUI goes with the customer, and Customer Account is where that continuity is expressed.
- Customer Account is the platform that makes the Concierge vision possible — and the window for capturing this value is now.

PART II — TUI Today

Group Customer Account, the 1web myTUI hub, and the capabilities already in customers' hands, described as they are. This part establishes shared factual ground — no argument, no critique.

Chapter 4 — Group Customer Account and the myTUI Platform Today

Executive Summary

TUI consolidated market-specific account solutions into a single global platform through Group Customer Account (GCA), and delivers a broad customer-facing experience through the 1web myTUI hub. This chapter describes that platform as it exists today.

4.1 From market-specific to global

Historically, different markets ran different identity solutions, registration experiences, and customer data stores. Group Customer Account replaced this with a common identity and account platform serving multiple source markets and brands — a substantial, completed transformation. This is what the organisation refers to as "One TUI Account" — a single, global customer identity.

4.2 The myTUI hub today

The 1web myTUI hub is the authenticated home where customers find their relationship with TUI in one place: sign in, manage profile, view bookings and trips, access rewards and loyalty, receive notifications, view deals, manage permissions, and use discovery and post-booking services.

4.3 One platform, many markets

The platform operates across multiple TUI source markets and brands from a shared foundation — the same core capabilities delivered consistently while accommodating language, currency, and market-specific needs. This shared, multi-market foundation is the asset the rest of this document builds upon.

Chapter 5 — The Current Capability and Technology Landscape

Executive Summary

A factual inventory of what exists today — capabilities, technology, data, and measurement.

5.1 Capabilities live today

Identity and access. Registration, authentication, permissions and consent management.

Profile and preferences. Personal profile information and basic declared preferences.

Bookings and trips. Consolidated booking view, Upcoming Trips with post-booking services.

Engagement and communications. Notification Centre and related messaging.

Loyalty and offers. Rewards (TUI Smiles) and Deals.

Discovery and saved items. mySearches, Recently Viewed, Shortlists.

Ancillaries and extras. Insurance, airport parking, car hire, transfers.

5.2 Technology foundation

The capability is delivered through a combination of platforms. For strategic purposes, the important point is the *capability each layer provides*, not the specific vendor — particularly as the identity layer is undergoing an active provider migration (from Gigya/SAP CIAM toward Ping Identity) that actually strengthens the platform's security and agent-readiness posture:

Capability Layer	Role
CIAM (identity provider)	Identity, authentication, consent — currently migrating from Gigya (SAP CIAM) to Ping Identity, adding MFA and modern security capabilities
Customer messaging	Customer messaging and engagement orchestration
Data collection & tagging	Behavioural data capture, event routing
Customer Data Platform (CDP)	Unified customer data and history
Content management	Content authoring and delivery
Cloud infrastructure	Compute, storage, secrets, email (AWS-based services including SES)
Front-end delivery	Micro-frontend architecture serving the 1web myTUI hub
APIs	Programmatic access to profile, preferences, and account data

Note: Specific vendor names are used where they are publicly documented or internally well-established. Where the technology landscape is evolving or the vendor relationship is not confirmed for this document's audience, the capability description is used instead.

5.3 Where customer data lives

Identity, authentication credentials, and consent live in the CIAM layer. Messaging and engagement data live in the messaging platform. Booking history, behaviour, and preferences — the "memory" of the relationship — live in the CDP. These systems each maintain their own customer identifier, connected today by a mapping. Strengthening that linkage into robust single-customer resolution is the key technical dependency named in Part IV.

5.4 The auth-provider migration — and why it strengthens this strategy

The live migration from Gigya (SAP CIAM) to Ping Identity is a significant FY27 initiative. Far from weakening the strategy, it directly supports it:

- **MFA and enhanced security:** Ping enables opt-in multi-factor authentication and advanced fraud-detection capabilities (Ping Protect) that the current platform does not provide.
- **Modern auth patterns:** OAuth 2.1, passkeys, and the scoped-token model needed for agent delegation become natively available.
- **Multi-IdP readiness:** The migration architecture supports running both providers in parallel, which is the same pattern needed for future extensibility.

The strategic argument in this document is anchored on the *capability* — authoritative identity, granular consent, and agent-delegation readiness — not on any single vendor. The migration is evidence that TUI is actively investing in that capability, not a contradiction of it.

5.5 Current measurement

Today's KPI set: Monthly Active Accounts, Login Rate, Registration Conversion, Returning Customers, Bookings via Logged-in Users, Loyalty Adoption, Profile Completion, Ancillary Revenue, NPS, CLV. Whether these are the *right* measures for the proposed strategy is addressed in Chapter 22 and Part V.

PART III — The Strategic Evolution

The core of the book: how each capability within Customer Account should evolve.

The operating model for Part III

Customer Account enables; it does not own. Its role is to provide trusted, reusable customer capabilities that other platforms and experiences consume. Where a chapter describes value delivered in Search, Loyalty, or the Concierge vision, Customer Account is the enabler, not the owner. This principle is stated once here and assumed throughout.

Four foundational capabilities anchor this part, with deliberate boundaries between them:

- **Identity** — who the customer is: authentication, resolution, consent. The anchor.
- **Profile** — declared, customer-controlled facts, including *requirements* (accessibility, dietary) that TUI must honour.
- **Travel Preferences** — declared travel, experience, and service *tastes*: revisable, time-bound, distinct from requirements.
- **Customer Context** — the unified, reusable view combining declared data, inference, and history, all governed by consent.

The remaining chapters — Notifications, Upcoming Trips, mySearches, Rewards, Recommended Ancillaries, AI Experiences — are *journey capabilities* that consume these foundations.

Chapter 6 — Identity

Executive Summary

Identity is the foundation everything else attaches to. Historically a security concern, it is better understood as the capability that lets TUI recognise a customer consistently, remember them across channels, and — in time — let them delegate authority to an AI agent.

What it is

Three functions: authentication (proving identity), resolution (recognising the same customer across web, app, retail, service, and marketing), and consent (recording what the customer has permitted). Group Customer Account established the shared platform; the question is how it evolves.

Why it matters now

Two shifts raise identity from plumbing to strategy. As discovery moves to AI channels, it is the authenticated relationship — not the anonymous session — that delivers continuity and earns return visits. And as AI agents begin to act on customers' behalf, the industry is converging on how they should authenticate: a scoped, time-limited, revocable credential distinct from the customer's own identity. TUI cannot participate safely in agent-mediated travel without an identity capability that can express "this agent may act for this customer, within these limits." Identity is therefore the precondition for both the human and the agent relationship.

The active CIAM migration (Gigya → Ping) directly serves this: Ping's OAuth 2.1 implementation and MFA capability are the technical foundation for both modern authentication (passkeys) and scoped agent delegation.

What good looks like

A single, robust resolution of one customer across every TUI system. Consent that is granular, revocable, and legible to the customer. Low-friction modern authentication such as passkeys. Readiness to issue delegated agent authority as that need matures.

How it strengthens the relationship

Identity makes the relationship continuous rather than episodic. It is why a returning customer is recognised and their context available. It is also the seat of trust — where the customer sees and controls what TUI knows and who may act on their behalf.

How it is measured

Identity resolution rate (the share of interactions resolved to one known customer), consent quality (granular, current, revocable), and the recognised-versus-anonymous conversion lift — the clearest commercial expression of identity's value.

Strategic Priorities

Single-customer resolution across the CIAM layer, messaging platform, and CDP is the priority — a cross-organisational undertaking to which Customer Account contributes the requirements and the identity-platform side, described fully in Chapter 16. Alongside it: instrument the recognised-versus-anonymous conversion lift as the value measure, and define the agent-delegation consent model ahead of need, targeting readiness in the FY28 horizon.

Chapter 7 — Profile

Executive Summary

Profile is the set of facts a customer deliberately declares and controls — the most trustworthy data TUI holds. This chapter draws a firm line: Profile holds *declared, customer-controlled* facts, including requirements TUI is obliged to honour, kept strictly separate from inferred behaviour (which belongs to Customer Context).

What it is

Identity and account facts — name, contact, documents, payment, companions — plus **requirements**: accessibility needs, dietary needs, and similar. Requirements are not preferences. They are obligations: failing to honour a declared mobility need is a service and compliance failure. Much of this data is special-category under GDPR and demands stricter consent, tighter access, and clearer retention than ordinary profile data.

Why it matters now

As personalisation moves from inference toward trusted understanding, declared data becomes the higher-confidence input. An external agent can guess at behaviour; it cannot hold what a customer has explicitly entrusted to TUI. Profile is the most trustworthy layer — and its reuse across journeys (through APIs) is the clearest expression of the "produce once, consume many times" principle.

What good looks like

A clear separation between declared and inferred, always visible to the customer. Requirements modelled as a distinct, stricter class and honoured across every journey. Data captured through transparent value exchange —

the customer understands why they are asked and what they get. And profile data reusable by every capability through APIs, never re-collected.

How it is measured

Not profile *completion* — a full profile of stale data is worse than a smaller, maintained one. The right measures are declared-data freshness and active maintenance, the requirement-honour rate (did TUI actually satisfy declared requirements?), and downstream relevance lift where profile data is consumed.

Strategic Priorities

Model requirements as a distinct, stricter-governed class, honoured end-to-end. Replace completion-based measurement with freshness and honour-rate. Expose profile through reusable APIs for cross-journey consumption.

Chapter 8 — Travel Preferences

Executive Summary

Travel Preferences are the travel, experience, and service tastes a customer declares — preferred airports, board basis, holiday styles. Distinct from Profile requirements, they are revisable and time-bound. Declared preferences are among the most defensible assets TUI can hold: they carry explicit consent and cannot be inferred by an outside agent.

What it is

A structured set of declared tastes across three domains — travel (preferred airports, seasons, destinations, board basis), experience (family, adventure, cycling, wellness), and service (assisted versus self-service, communication style). Preferences shape relevance; they do not create obligations. Accessibility and dietary needs are excluded by design — they are requirements and belong to Profile.

Why it matters now

Declared preferences are the practical answer to the commoditisation risk set out in Chapter 3. When behaviour can be inferred by any agent, the durable asset is what the customer has *consented to tell TUI* about how they like to travel. Declared preferences describe intent; observed behaviour only suggests possibility. Together — declared, validated by observed — they produce trustworthy understanding, and the declared half is the part TUI uniquely owns.

What good looks like

Preferences captured with a clear value exchange and managed through a full lifecycle: created, used, reviewed, and allowed to expire or be re-confirmed. A preference with no decay is a liability — confidence should fade until re-confirmed. And preferences must be reusable across journeys, not trapped in myTUI. The proof of this capability is not the preference centre itself but the first journey outside it that consumes preferences and demonstrably outperforms the generic experience.

How it is measured

Coverage and freshness of high-value preference domains (not raw completion), and the relevance and conversion lift where preferences are consumed compared with generic experiences.

Strategic Priorities

Ship a declared-preferences capability with real value exchange, consumed in at least one live journey — the first bet of the FY27 horizon. Build the preference lifecycle and decay in from the start rather than retrofitting them. Establish declared preferences as the consented, defensible asset in TUI's strategic positioning.

Chapter 9 — Customer Context

Executive Summary

Customer Context is the unified, reusable understanding of a customer — combining declared data (Profile and Preferences), behavioural inference, and history — governed by consent. It is the single concept the rest of this book means by "understanding." Customer Account is the trusted *gateway* to context; the engine that produces the inferred portion is described in Part IV.

What it is

Context answers "who is this customer, right now, for this trip?" It layers identity, memory (CDP history), declared preferences, and behavioural inference into one view. Crucially, it recognises that a customer is not static: the same person is a family traveller on one trip and a cycling companion on another. Context is dynamic and journey-aware, not a fixed segment.

Why it matters now

Where Chapter 8 argued that declared data is uniquely defensible, context is where that data becomes *usable at scale*. As AI becomes the interface, the differentiator is not the model — every travel company will have capable models — but the quality of consented, trip-spanning context available to it. That is what no external agent can replicate.

What good looks like

One consented, reusable context, exposed to every capability and, with permission, to authorised agents. It always distinguishes declared fact from inference and carries a confidence signal. And consent travels with the data: an attribute may only be reused where the customer permitted that use.

The full context read matures in stages. Declared profile and preference data can be exposed cleanly first; the inferred and behavioural layers depend on single-customer resolution and the intelligence capability described in Part IV, and arrive in the FY28 horizon. The in-resort dimension — context that spans the trip itself — depends on integration with hotel, cruise, and excursion platforms and is realistically a multi-year ambition.

How it is measured

Reuse (how many journeys consume shared context rather than re-deriving their own), relevance and conversion lift where context is applied, and consent coverage of reused attributes.

Strategic Priorities

Expose declared profile and preferences as the first "context-lite" read and prove reuse in one journey. Layer in behavioural inference once identity resolution and the intelligence capability exist. Name the in-resort data gap explicitly and treat it as the multi-year dependency it is.

Chapter 10 — Notification Centre

Executive Summary

The Notification Centre is where the relationship stays warm between trips and helpful during them. Its value is relevance and timing, not volume.

It is the consented channel for reaching a known customer with updates tied to bookings, interests, and journey stage. Proactive, relevant contact — a disruption alert, a timely prompt — is core to being a trusted companion: done from context it feels like care; without context it feels like spam. Good looks like notifications driven by context and journey stage, with the customer in clear control of channel and frequency and consent respected as first-class. The measures that matter are relevance and engagement, opt-in health, and unsubscribe rate as a signal of trust erosion. The strategic priority is connecting notifications to context rather than the campaign calendar.

Chapter 11 — Upcoming Trips

Executive Summary

Upcoming Trips is the post-booking heart of the relationship — the period when the customer is most engaged and most in need of TUI's help.

It is the consolidated view of booked and upcoming travel with its supporting services. Post-booking is where trust is earned or lost — preparation, disruption, in-trip support — and where relevant ancillary and excursion value is created. Good looks like dynamic, stage-aware support across the whole arc (prepare → travel → in-resort → return), proactive disruption handling, and recommendations grounded in the specific trip and customer context. It is measured by post-booking engagement, the share of disruptions handled proactively, and in-window ancillary and excursion attach.

The strategic priority is to make Upcoming Trips stage-aware and context-driven, treating disruption handling as a signature moment of the relationship. The in-resort portion of this ambition depends on joining Account to hotel, cruise, and excursion platforms — a multi-year integration across different technology estates, and one of the named dependencies in Appendix A.

Chapter 12 — mySearches

Executive Summary

mySearches captures intent — the clearest signal a customer gives about what they are trying to do next.

It holds saved searches and search activity for a known customer, retained across sessions and devices. As discovery fragments across AI channels, capturing and continuing a customer's expressed intent inside TUI brings inspiration-to-intent back into an owned relationship. Good looks like intent captured, continued across sessions and channels, and fed into Customer Context so the next experience picks up where the last left off. It is measured by intent capture and continuation rate, and return-to-book from saved intent.

Chapter 13 — Rewards

Executive Summary

Rewards (TUI Smiles) is where the relationship is made worth returning to — differentiation beyond the transaction. As the Loyalty programme scales from 1m members (FY26) to a projected 5m (FY27) and 8m (FY28), Account becomes the critical enabler: identity is the foundation members are enrolled on, and the preferences and context layer is what makes loyalty personal rather than generic.

What it is

The loyalty capability: membership, status, points, and member value, integrated into the account. When inventory commoditises, loyalty is what rewards direct booking and deepens retention; it is also a strong source of consented, declared data and a concrete reason to maintain the relationship rather than routing through a neutral agent.

Why it matters now

The Loyalty Solutions 3-Year Plan sets four objectives that compound on Account:

1. **Launch Loyalty club** across markets and entities — requiring account (hub) presence in each entity (the Onboardings dependency).
2. **Build base rapidly** — majority of accounts enrolled in Loyalty, with key results on enrolment percentage of active accounts and new customers.
3. **Engage base** — interaction beyond viewing or transaction, measured by Active Engagement Rate (MAU volume and % of member base) and frequency of interaction.
4. **Loyalty makes TUI more personalised, especially in app** — NPS uplift for members, data completeness, and personalisation engagement rate.

Account is the precondition for each: you cannot enrol what you have not identified; you cannot personalise what you do not understand; you cannot engage what you cannot reach.

A significant strategic shift is underway: **exclusive offers — historically the primary lever for new account generation — are migrating to become Loyalty-exclusive**. This means Account growth and Loyalty growth become mutually reinforcing: the incentive to create an account increasingly *is* the incentive to join the Loyalty programme. The strategy must account for this shift in how it measures and drives the active base.

What good looks like

Loyalty enriched by context — relevant, personal member value rather than generic points mechanics — incentivising direct and repeat booking and connected to the app, where engagement concentrates. Good also looks like frictionless enrolment paths in the search and booking flow (a "Must" FY27 initiative), so that the Loyalty base grows as a natural by-product of the journey rather than through standalone campaigns.

How it is measured

Loyalty-linked repeat-booking rate, redemption engagement, Active Engagement Rate (MAU as % of member base), enrolment percentage of active accounts, and the retention difference between members and non-members.

Strategic Priorities

Enable frictionless loyalty enrolment as a shared "Must" workstream (Account provides the identity path; Loyalty owns the programme). Ensure Account onboardings (Airline, Sundeals, TUI Iberia) land data into the ecosystem

as a pre-requisite for Loyalty enrolment in those entities. Support the migration of exclusive offers from account-exclusive to Loyalty-exclusive by maintaining account growth through the value of the relationship itself — preferences, personalisation, convenience — rather than offer gating alone. The loyalty programme itself has its own owner (CodeArtisans); Customer Account provides the identity, context, and enablement layer beneath it.

Chapter 14 — Recommended Ancillaries

Executive Summary

Recommended Ancillaries is where relevance becomes margin — better understanding producing direct commercial value.

The capability is ancillary and excursion recommendations driven by the customer's booking and context rather than generic promotion. Ancillary attach is a direct margin lever in TUI's strategy, and context-driven relevance — the right offer at the right moment — converts better than generic upsell. Good looks like recommendations grounded in booking stage and context, timed to need, and consumed by merchandising systems: Customer Account provides the context, not the catalogue. The measure is attach rate and margin lift of context-driven recommendations over generic ones. This capability naturally belongs to the FY28 horizon, because it depends on identity, profile, and context being in place first.

Chapter 15 — AI Experiences

Executive Summary

AI Experiences is where Part III's foundations become customer-facing intelligence — conversational, agentic, and proactive experiences built on identity, context, and consent. The Concierge vision owns these experiences; Customer Account provides the trusted capabilities they depend on.

What it is

Customer-facing AI capabilities — conversational trip-building, proactive support, agent-mediated interactions — built on identity, context, preferences, and consent.

Why it matters now

This is the payoff of everything preceding it. Every travel company will have capable AI; the differentiator is the quality of consented context available to it, and that context is what Customer Account provides. The Sales Solutions Concierge vision — a smart, trusted, always-on companion — describes the *experience*; Customer Account provides the *platform* it depends on.

To be clear on maturity: the Concierge vision is at the strategic and early-discovery stage within Sales Solutions, not yet a committed, funded programme with delivery dates. This strategy does not depend on Concierge being funded — it argues that Customer Account capabilities have independent value (reuse, retention, personalisation) while simultaneously being the prerequisite for the Concierge vision *when* it is ready. The sequence works either way; but it works faster and more powerfully when the Concierge vision materialises.

What good looks like

AI experiences that draw on consented context, keep the customer visibly in control, and can — with scoped, revocable permission — let authorised agents act on the customer's behalf. On delegation, an honest note on

timing: agent-identity standards are still settling as of mid-2026. OAuth 2.1 scoped tokens are established, MCP authorisation is emerging, and EU Digital Identity Wallet (eIDAS 2.0) timelines vary by member state — it is a near-term legal reality in terms of mandate but at early practical maturity in terms of cross-border implementation. The right strategy is to prepare the consent model and scope definitions now, and commit to a specific protocol implementation only once standards stabilise — readiness in the FY28–29 horizons, not premature deployment.

The PSD2 consent model (granular, per-resource, revocable, time-limited) provides a useful *analogy* for how agent delegation might work — not because PSD2 literally extends to AI agents, but because the consent architecture pioneered in open banking is the closest established precedent for "scoped authority granted by a customer to act on their behalf within defined limits." The pattern, not the regulation, is what transfers.

How it is measured

Task completion, customer satisfaction with AI interactions, and AI-assisted conversion — always evaluated for whether they strengthen the relationship, not merely automate it.

Strategic Priorities

Treat context, consent, and identity as prerequisites rather than parallel workstreams. Keep the customer in control by design. Prepare the agent-delegation framework as the interface matures.

PART IV — Platform Enablement

How the underlying platforms combine to enable Customer Account. This part is about enablement, not customer-facing capability.

Chapter 16 — Platform Enablement Overview

Executive Summary

Customer Account is not a single system. It is a set of trusted customer capabilities delivered by orchestrating platforms that already exist. This chapter sets out how those platforms combine — and names the one hard dependency on which the whole model rests. **This is the most important technical chapter in the document, because identity resolution is the single decision that gates or enables everything that follows.**

16.1 The enablement principle

Customer understanding must be produced *once* and consumed *many times*, rather than re-derived by every application. The value of the platforms below is realised only when they are orchestrated into a single, consistent read of the customer.

16.2 The responsibility model

Layer	Capability	Responsibility
Identity & consent	CIAM (migrating Gigya → Ping)	Who the customer is; authentication; what they have permitted
Customer data & history	CDP	Unified profile and relationship memory
Messaging & orchestration	Customer messaging platform	Right message, right channel, right moment
Service & reuse	Reusable APIs / service layer	APIs the rest of TUI consumes
Content	Content management	Content that populates and personalises experiences
Measurement	Analytics & data collection	Data collection, measurement, experimentation
Interpretation	AI/Intelligence layer	Turning data into consented, confidence-scored understanding

The boundaries are deliberate: the CIAM layer holds identity and consent, not history. The CDP holds history, not consent. The messaging platform delivers; it does not decide. The intelligence layer interprets; it does not become another store of record.

16.3 The one hard dependency — and the commercial case for fixing it

The CIAM layer, messaging platform, and CDP each maintain their own customer identifier, connected today by a mapping. That mapping is the seam. Until it is hardened into single-customer resolution — so that any capability can ask "who is this customer?" and receive one trusted answer — the reusable context of Part III cannot be produced reliably.

Why this is the most important investment decision in this strategy:

Resolution is not an abstract architectural improvement. It is the gate that determines whether TUI can: - Deliver context-driven personalisation across journeys (the preference-relevance lift of Chapter 8) - Produce consistent

Customer Context consumed by multiple surfaces (Chapter 9) - Enable context-driven ancillary recommendations (Chapter 14) — a direct margin lever - Power the Concierge vision with trusted, unified customer understanding

The commercial argument, stated directly: The 3-Year Plan projects 17m active accounts (2-year window) in FY26, growing to 19m in FY27 and 21m in FY28 — a +12% CAGR. At a 38% rebooking rate and ~€3,500 average booking value, each percentage-point improvement in retention represents approximately €595m in incremental revenue at FY26 scale, growing with the base. Context-driven personalisation — which requires resolution — is the primary lever for that improvement. Even a conservative estimate of 0.5-point retention uplift from unified context represents ~€300m incremental revenue opportunity over the 3-year horizon. This is before the ancillary margin impact: a 2-point improvement in ancillary attach (from a ~50% base, worth ~€200–400 per booking in margin) across millions of post-booking interactions represents tens of millions in direct profit contribution.

Resolution is not a nice-to-have. It is the single investment that unlocks the majority of this strategy's commercial value. **The FY27 measurement baseline (Chapter 25) exists specifically to build the quantified evidence that makes this cross-organisational investment undeniable.**

Resolution is a cross-organisational undertaking: it spans the identity platform, the data platform, and the marketing-technology estate, and requires architectural direction across all three. Customer Account's role is to define the need clearly, advocate for its prioritisation, and deliver the identity-platform portion. This strategy presents resolution honestly: as the dependency everything compounds on, requiring investment beyond any single product area. Its treatment as a risk is covered in Appendix A.

16.4 Consent travels with the data

Consent is not a gate checked once at collection but a property that travels with every attribute wherever it is reused: an attribute may only be used for a purpose the customer permitted. This is what allows Customer Account to expose context broadly without eroding trust.

Chapter 17 — Identity and Consent: The CIAM Capability

Executive Summary

The CIAM layer is the anchor: authentication, the authoritative consent record, and the base for delegated agent authority. The active migration from Gigya (SAP CIAM) to Ping Identity is adding MFA, modern OAuth, and the security posture the AI era demands. The strategic argument is anchored on the *capability* — not the vendor — and the migration strengthens it.

What it enables

Authentication, the authoritative consent record, and the identity attributes every other system attaches to.

The migration: from Gigya to Ping

The Gigya → Ping migration is a live FY27 "Must" priority. It delivers: - **Multi-factor authentication (MFA):** opt-in additional security, activatable in response to critical events. - **Ping Protect:** AI-driven fraud detection, behavioural analytics, anomaly detection on login patterns, and risk scoring. - **Modern auth protocols:** OAuth 2.1, passkeys, and the scoped-token architecture needed for agent delegation. - **Multi-IdP support:** the ability to run multiple identity providers in parallel during migration and beyond.

The migration does not change the *role* of the CIAM layer — it strengthens the capability within that role. The strategic logic of this document holds regardless of which vendor delivers the capability; the migration is additive, not contradictory.

Its role in the AI era

Two shifts make CIAM more strategic. The move to declared first-party data with granular consent is exactly the posture Profile and Preferences rely on. And agent delegation — scoped, revocable credentials for agents acting on behalf of customers — will be issued and governed from the identity platform. Ping's OAuth 2.1 implementation is natively suited to this.

What good looks like

Modern, low-friction authentication (passkeys); consent that is granular, current, revocable, and legible to customers; and a platform ready to issue scoped agent authority as the need matures.

The delegation model has a proven *analogy*: the granular, per-resource, revocable consent architecture used in open banking (PSD2). TUI is not extending PSD2 to AI agents, but the consent pattern — scoped authority, time-limited, customer-revocable, auditable — is the closest established precedent for how agent delegation should work. Regulatory momentum reinforces the timing: the EU Digital Identity Wallet (eIDAS 2.0) mandates verifiable, customer-controlled digital identity across EU member states. This is a near-term legal reality in terms of mandate, though at early practical maturity in terms of cross-border implementation — the regulation is passed and timelines are set, but operational readiness varies by member state.

The gap to close

The CIAM migration is in progress and addresses the security and protocol gaps. The remaining strategic gap is the identity-resolution mapping described in Chapter 16, and defining the agent-delegation consent model ahead of need.

Chapter 18 — The Customer Data Platform

Executive Summary

If the CIAM layer is *who* the customer is, the CDP is *what TUI remembers about them* — the richest customer data TUI holds: bookings, behaviour, and preferences over time. It is the memory of the relationship.

What it enables

Unified customer data and accumulated history: where a customer has travelled, how they behaved, what they booked, what they declared. This is what makes the relationship continuous rather than episodic.

What good looks like

Identity resolution first: the CDP must resolve to the same customer that the CIAM layer and messaging platform recognise. Beyond that, history held in a form the intelligence layer can interpret, declared data distinguished from observed, and activation always governed by consent.

Its place in the model

The CDP is the store of history and unified profile. It is not the consent record (that is the CIAM layer) and not the interpretation engine (that is Chapter 23). Its critical dependency is identity resolution.

Chapter 19 — Messaging and Orchestration: Braze

Executive Summary

Braze is how the relationship reaches the customer — the right message, channel, and moment. Its value is realised only when it acts on context rather than broadcast rules.

Braze is the actuator, not the brain: it executes orchestration decisions, while the decisions themselves come from customer context and journey stage, governed by consent held in the CIAM layer. Good looks like messaging triggered by context and booking stage rather than the campaign calendar, with the customer in clear control, and success measured by relevance and opt-in health rather than send volume.

Chapter 20 — The Service Layer

Executive Summary

The service layer is what makes "enable, don't own" real in practice — the reusable APIs through which the rest of TUI consumes Customer Account capabilities.

Why it is strategic

Reuse is the leading indicator that Customer Account has become infrastructure. Every journey that consumes a shared capability instead of re-deriving its own stays consistent and avoids duplication.

What good looks like

Well-defined, versioned, consent-aware APIs exposing identity, profile, preferences, and context — adopted by more than one journey, and carrying declared-versus-inferred and confidence signals.

One pragmatic caveat: the maturity of a unified service gateway varies across TUI's technology estate. In some domains, well-governed, centrally-managed API gateways exist; in others, services are more directly integrated. The strategic requirement is not a specific architectural pattern but the *outcome*: that customer capabilities are exposed as documented, reusable, consent-aware APIs that other teams can consume without re-implementing the logic. Pragmatism over architectural purity — what matters is reuse, not the label on the gateway.

Chapter 21 — Content: Contentful

Executive Summary

Contentful populates and personalises the experiences Customer Account enables — turning decisions into something the customer actually reads: the right message, offer, or guidance for the moment.

Personalisation is only as good as the content available to personalise: context can determine that a customer should see cycling-oriented inspiration or a stage-appropriate pre-trip prompt, but that relevance is realised only if the content exists and is structured to be selected and assembled dynamically rather than authored as fixed pages. Content also does double duty in the AI era: the same structure that serves dynamic personalisation keeps TUI legible to LLMs and agents — machine-readable content is what lets TUI remain visible in AI-generated answers. Well-structured content serves the human and the agent at once. Within the model,

Contentful supplies the material; it does not decide what to show, and it holds no customer data. It is the expression layer.

Chapter 22 — Analytics and Experimentation

Executive Summary

Analytics is how the strategy stays honest — the layer that measures whether capabilities create value and proves that context-driven experiences beat generic ones.

The measurement shift

This strategy replaces login-era measures with relationship and value measures. The current KPI set (Chapter 5.5) counts activity: logins, registrations, profile completion. The proposed set measures whether the relationship is working:

- Recognised-versus-anonymous conversion lift
- Requirement-honour rate
- Declared-data freshness
- Context reuse across journeys
- Relevance lift where context is applied
- **Annual Active Users (AAU)** — the share of 2-year active accounts that are also active within 1 year, as a measure of relationship continuity (3YP target: 75% by FY29, 80% by FY30)
- **Logged-in percentage** (App & Web) — the primary measure for "Identified from early in journey"

This shift is not cosmetic. A strategy that argues against login-era thinking cannot govern itself with login-era metrics; Part V holds each horizon accountable to the new measures.

The logged-in experience as a measurement initiative

Understanding the difference between logged-in and anonymous customer behaviour is not merely an analytics question — it is an active initiative. The capability needed: logged-in vs guest analytics, funnel and conversion tracking per authentication state, and UX optimisation for authenticated users. This work directly feeds the recognised-versus-anonymous conversion lift metric and produces the evidence that the authenticated relationship has measurable commercial value. It is a prerequisite for the FY27 measurement baseline described in Chapter 25.

LLM share of voice

A new, buildable per-market leading indicator: how prominently TUI appears in AI-generated answers, instrumented as an owned metric — mention rate, citation rate, sentiment, sampled across models. Measurement and optimisation of AI visibility sit with the traffic and AEO function rather than Customer Account; Customer Account's interest is as a consumer of the insight, in particular whether a recognised customer relationship correlates with stronger AI-channel performance.

Chapter 23 — AI, Intelligence and Decisioning

Executive Summary

This is the layer that turns everything below it into understanding. The platforms in the preceding chapters hold data — identity, history, messages, content, behaviour. On its own, that data is fragmented and inert. The intelligence layer interprets it: producing the consented, confidence-scored Customer Context that Part III consumes, and making the Next Best Action decisions that messaging and journeys act on. Critically, it is a *capability*, not another system of record.

23.1 The missing layer

Most organisations operate three layers: presentation, business logic, and data. The intelligence layer is a fourth, sitting between the data and the capabilities that consume it:

```
Customer Experience
        ↓
Business Capabilities
        ↓
Customer Intelligence
        ↓
Enterprise Data
```

Its introduction changes one thing fundamentally: applications no longer interpret customer data independently. The intelligence layer becomes responsible for customer understanding, and every application consumes the *same* interpretation. Consistency replaces duplication — the architectural expression of the "produce once, consume many times" principle from Chapter 16.

23.2 From data to understanding

Raw data has limited strategic value; understanding emerges only after interpretation. Consider two customers who both booked Mallorca, in October, for around €2,000. On the data, they are identical. Interpreted, they are not: one repeatedly chooses cycling holidays, the other consistently books luxury spa resorts. The booking record was the same; the understanding was entirely different. It is understanding, not data, that creates differentiation — and understanding is what the intelligence layer produces.

TUI already holds enormous quantities of customer information across bookings, the CIAM layer, messaging, the CDP, analytics, search, and app behaviour. The challenge has never been collecting it. The challenge is interpreting it consistently, and that is precisely the gap this layer fills.

23.3 What it produces

Three things, in ascending order of value. **Understanding with confidence:** every insight carries a confidence signal — high for explicitly declared preferences, medium for repeated behavioural patterns, low for a single observation — so consumers can automate on high confidence and explore on low. This is the mechanism behind the declared-versus-inferred distinction that runs through Part III. **Relationships, not isolated facts:** travel is naturally relational — a customer travels *with* a companion, *prefers* boutique hotels, *usually flies from* a given airport. Modelling these as a knowledge graph rather than isolated attributes is what allows understanding to compound; it emerges from the connections, not the fields. **Decisions:** beyond describing the customer, the layer arbitrates what should happen next, across channels, for this customer, right now — the operational core of the Concierge orchestration the wider strategy envisions.

23.4 The intelligence flywheel

The layer is designed to improve itself. The customer shares information; intelligence interprets it; the experience demonstrates value; the customer trusts enough to share more. Each cycle deepens understanding and earns further permission. The flywheel works only if the customer perceives benefit — which is why transparency, control, and visible value exchange are governance requirements, not just nice-to-haves.

23.5 Intelligence requires permission

As the layer grows more capable, governance grows more important in equal measure. Every inference and decision operates within explicit consent, and consent travels with the data (Chapter 16). Transparency is treated as a competitive advantage, not a compliance burden: the customer should be able to see what TUI knows, why it knows it, how it improves their experience, and how they remain in control. Trust grows through visibility, not secrecy — and in the AI era, that visible control is itself a differentiator an external agent cannot offer.

23.6 Not another system

The most important discipline: this layer must not become another database or profile store. It is the capability that transforms fragmented information into consistent understanding — consuming what other platforms hold, and exposing context through APIs.

PART V — Strategic Horizons

How the strategy unfolds. Sequenced by dependency, not ambition — and held accountable to value, not output. Detailed delivery planning lives outside this document; what follows is the strategic logic of the sequence.

The shape of the sequence

The horizons follow one line of dependency: **resolution → reuse → companion → relationship platform**. Each consumes what the previous one established. And each must produce *measurable value* — a horizon that ships capability without moving a relationship or value measure has not succeeded.

Two kinds of work run through every horizon: what Customer Account establishes directly, and what it depends on the wider organisation to establish — above all single-customer resolution (Chapter 16), AI-channel visibility, and in-resort data integration. The strategy treats those dependencies openly rather than absorbing them into its own promises; they are catalogued in Appendix A.

Chapter 24 — Sizing the Prize: The Commercial Case

Executive Summary

Before committing to horizons and delivery, this chapter sizes the commercial opportunity — conservatively, with explicit caveats — to answer the executive question: "What is this worth?"

24.1 The value levers

Customer Account's strategic evolution creates value through five distinct levers:

Lever	Mechanism	Where in the strategy
Retention	Recognised, personalised customers rebook more often	Identity, Context, Loyalty
App-channel shift	Account-exclusive features drive app adoption	Travel Preferences, Notifications, Rewards
Ancillary & excursion margin	Context-driven recommendations convert better than generic	Recommended Ancillaries, Upcoming Trips
Acquisition cost reduction	First-party relationships reduce paid-channel dependency	Identity, Profile
Operational efficiency	Self-service, pre-filled data, proactive disruption handling	Profile, Upcoming Trips, Notifications

24.2 Indicative value ranges

These are conservative, clearly-caveated estimates based on the Account Solutions 3-Year Plan projections and published TUI figures. They represent the *opportunity* enabled by the strategy, not a delivery commitment.

The active-account base:

Metric	FY25	FY26	FY27	FY28	CAGR	FY29	FY30
Active Accounts (2yr)	15m	17m	19m	21m	+12%	22m	23m
Active Accounts (1yr)	11m	13m	15m	16m	—	17m	18m
Loyalty members	—	1m	5m	8m	—	TBC	TBC
AAU (1yr as % of 2yr)	—	—	—	—	—	75%	80%

The 3YP targets stretching double-digit growth. "Active" is defined as identified on app or web in the last 2 years. Targets are based on a model evaluating new (~3.5m/yr) and reactivated (~0.5m/yr) accounts each year, minus those falling out of the 2-year active window to dormancy (~2m/yr).

Retention uplift: - Base: ~17m active accounts (FY26, 2-year window); 38% rebook within 2 years. - A 1-point improvement = ~170,000 incremental repeat bookings. - At ~€3,500 ABV = ~€595m incremental revenue per retention point. - Conservative estimate of strategy impact: 0.5–1.5 points over FY27–FY29 = **€300m–€890m cumulative incremental revenue**. - Note: retention improvement has a lower acquisition cost than new customers (no paid-media spend), so the margin contribution is disproportionately high.

App-channel shift: - Published value: ~€1m per point from online, ~€8.7m per point from retail. - TUI target: 21% app share by FY29 (current ~12%). - Account-exclusive features (preferences, alerts, sharing, loyalty) are among the primary drivers of app adoption. - Conservative attribution to Account strategy: 2–3 points of the ~9-point gap = **€20m–€30m annual value**.

Ancillary & excursion attach: - Current attach: ~50% at book, ~8.5% in MMB. - Context-driven recommendations (right offer, right moment, right customer) vs generic: industry benchmarks show 15–30% conversion improvement for personalised recommendations. - A 2-point absolute improvement in post-booking attach across ~3m bookings, at ~€200–400 margin per attach = **€12m–€24m incremental annual margin**.

Acquisition cost reduction: - Harder to isolate, but each point of unpaid/direct traffic share recovered represents significant paid-media savings. - Qualitative: a recognised, engaged customer base that returns without paid re-acquisition is the definition of a sustainable digital business.

24.3 Total addressable value

Combining the quantifiable levers: **€330m–€940m in cumulative value over FY27–FY29**, heavily weighted toward FY28–29 as capabilities compound. This does not include the harder-to-quantify benefits of operational efficiency, brand trust, and competitive defensibility.

These are rough, directional ranges — explicitly caveated and intended to frame the order-of-magnitude opportunity, not to serve as a business case. A formal business case with validated assumptions should be produced as part of the FY27 mobilisation.

24.4 What this means for investment prioritisation

The commercial case makes one thing clear: **identity resolution is the highest-ROI single investment in this strategy.** Without it, the retention, ancillary, and personalisation levers cannot be pulled at scale. With it, every lever amplifies the others. This is why Chapter 16 names resolution as the one hard dependency — and why the FY27 horizon prioritises building the evidence that makes the cross-organisational case undeniable.

Chapter 25 — FY27: Foundation and First Reuse

Theme

Prove that reuse works. Establish one high-value declared-data capability, expose it for consumption beyond myTUI, and start measuring the right things — while making the case for identity resolution as the cross-organisational priority it is. Simultaneously deliver the "Must" operational commitments that secure the platform and expand the addressable base.

What the horizon establishes

Declared Travel Preferences, consumed in a live journey. The first bet: preferences captured with genuine value exchange, built with lifecycle and decay from the start, and consumed in at least one journey outside the account itself. The point is not the preference centre — it is the first demonstration that a journey drawing on declared data outperforms the generic experience.

Reusable Profile and Preference APIs. Clean, consent-aware APIs exposing declared profile and preference data, with at least one consuming journey genuinely integrated — published APIs alone prove nothing.

Requirements handled as obligations. Accessibility and dietary needs modelled as a distinct, stricter-governed class under Profile, honoured end-to-end in at least one flow, with measurement shifting from profile completion to freshness and honour-rate.

A measurement baseline. Recognised-versus-anonymous conversion lift, preference-relevance lift, Annual Active Users (1yr as % of 2yr), and logged-in percentage (App & Web) instrumented — the relationship and value metrics that govern every subsequent horizon, established before scale is attempted. The logged-in experience optimisation work (logged-in vs guest analytics, funnel and conversion tracking per authentication state) is what produces this baseline.

The commercial case for identity resolution, quantified. The FY27 measurement baseline is not just a reporting exercise — it is the evidence that makes the resolution investment case undeniable. By measuring the recognised-vs-anonymous lift and the preference-relevance lift in real journeys, Customer Account produces the hard numbers needed to secure cross-organisational commitment to resolution in FY28.

CIAM migration progress. The Gigya → Ping migration continues as a parallel "Must" workstream, delivering MFA, Ping Protect, and modern auth — strengthening the identity foundation while the value case builds.

Onboardings (Airline, Sundeals, TUI Iberia). A "Must" delivery workstream: implementing Group account experience (1web hub) and data structure in additional TUI entities so that customer data enters the ecosystem. This is both a "One TUI Account & Hub" objective delivery and a pre-requisite for Loyalty enrolment in those entities. Capabilities required: configurable account experiences, API/MFE onboarding framework, and data harmonisation (integration with Rez Systems and entity-specific booking platforms).

Frictionless Loyalty enrolment enablement. A shared "Must" initiative with the Loyalty team (CodeArtisans): ensuring customers can easily act upon Smiles Reward Club messaging in the search and booking flow. Account provides the identity path; Loyalty owns the programme logic and merchandising. This directly supports the Loyalty 3YP target of 5m members by FY27.

Account-exclusive capabilities: Price Alerts on Shortlist. A "Should" bet with high value (CVR uplift / MAU): account holders receive updates (including Push Notifications) when prices change on their favourite holidays. Capabilities required: shortlist/wishlist management, event-driven notification system, personalised alert rules. This is one of the strongest "encourage early login with myTUI exclusive features" drivers and does not depend on identity resolution — it can land in FY27 alongside Preferences as a tangible, immediate-value account incentive.

GAS legacy decommissioning. A "Must" operational workstream: leveraging the migration to the 1web account hub and group services by retiring old, unsupported services. Capabilities: group invitation process with Amazon SES Mail management, agency fraud monitoring and observability.

Deliberately deferred to later horizons: the full Customer Context read with behavioural inference, the agent-delegation framework, context-driven ancillaries, and in-resort integration — each because its dependency is not yet in place, not because it matters less. Chasing agentic checkout in particular is not an FY27 priority: the trust gap of Chapter 3 means the transaction layer buys time; discovery-stage visibility does not.

The value FY27 is accountable for

One live journey demonstrably consuming declared preferences with measurable lift; reusable APIs with at least one external consumer; a requirements model honoured end-to-end; a value-metric baseline (including AAU and logged-in %) that did not exist before; a quantified resolution business case ready for cross-organisational investment decision; onboardings live in at least one additional entity; Loyalty enrolment paths enabled in bookflow; price alerts live as an account-exclusive feature; and GAS decommissioning progress per plan.

Chapter 26 — FY28: Reuse at Scale and the Consented Context

Theme

Turn one proof of reuse into the default. FY28 is where Customer Account becomes genuine infrastructure — conditional on identity resolution having progressed.

What the horizon establishes

The first consented, reusable Customer Context read. Building on resolution, unified context — declared data, memory, and inference — exposed as a confidence-carrying read and consumed across multiple journeys.

The intelligence capability stood up as a shared producer of context. The interpretation layer of Chapter 23 formalised — confidence scoring and the first Next Best Action decisions — so that context is produced once by a shared capability rather than interpreted independently by each journey. This is the prerequisite for the context read above, not a parallel initiative.

Reuse broadened from one consumer to several. Search, merchandising, and post-booking journeys drawing defaults and context from shared APIs rather than re-deriving their own.

Context-driven Recommended Ancillaries. With identity and context in place, recommendations driven by booking context rather than generic promotion — the strategy's first direct margin impact. Based on the sizing in Chapter 24: a 2-point improvement in post-booking attach represents €12m–€24m incremental annual margin.

Preference lifecycle maturity. The full create → use → review → expire/re-confirm cycle live, with freshness as a managed measure.

The agent-delegation model defined. Consent structure and scope definitions prepared and aligned to whichever protocol standard has stabilised — readiness, not yet deployment.

Sharing of bookings and shortlist via accounts. Account holders who own a booking can easily share it with other travellers to their existing account or to a new one for them to activate. This helps TUI capture account-to-account relationships and enable guest collaboration at planning stage — a driver of active accounts and MAU.

The value FY28 is accountable for

Multiple journeys consuming shared context; measurable relevance and conversion lift where context is applied; context-driven ancillary attach lift over generic; preference freshness live as a managed measure; Loyalty members tracking toward 8m target; sharing capability live and driving incremental account activations.

The honest condition

If identity resolution has not progressed by FY28, the full context read is blocked. The fallback is to keep expanding declared-data reuse — which does not depend on resolution — while the case for the cross-organisational work continues to be made with the FY27 evidence. This is a real risk, not a hypothetical one, and it is why FY27's measurement baseline matters: it is the commercial argument for prioritising resolution.

Chapter 27 — FY29: The Trusted Companion and the Agent Interface

Theme

Make the relationship always-on, and make TUI ready to participate safely in agent-mediated travel. By FY29 the foundations exist to express the relationship as a genuine companion — the realisation of the vertical-integration advantage articulated in Chapter 3.

What the horizon establishes

AI experiences built on consented context. Conversational trip-building and proactive support that draw on context to feel personal while keeping the customer in control — the horizon where the Concierge vision can be fully realised, with Customer Account as the platform beneath it. (Conditional on the Concierge vision being funded and prioritised; the capabilities are independently valuable regardless.)

The agent-delegation framework live. Scoped, time-limited, revocable authority for authorised agents — provable and auditable. This is what lets TUI participate in agent-mediated booking without ceding the relationship.

Trip-spanning context, if the in-resort dependency has closed. Account joined to in-resort platforms so that context genuinely spans the whole trip — the "only TUI goes with you" promise made literal. Explicitly conditional on multi-year integration progress across hotel, cruise, and excursion technology. This is where TUI's vertical integration becomes a customer-facing, lived advantage rather than just an operational structure.

Loyalty enriched by context. Personal, context-driven member value that rewards direct and repeat booking, concentrated in the app. App as the home of Loyalty — app-led loyalty interactions, personalised offers, wallet enhancement — reinforcing the 21% app-share target.

Preferences and personalisation centre maturity. Account holders can see what their personalisation is based on and edit it — the experience more tailored, in sync with wider TUI messaging, and visibly under customer control.

The value FY29 is accountable for

Named against TUI's target of **21% app share by FY29**. Every point of app-channel shift is worth roughly €1m from online and €8.7m from retail, which is why the companion, loyalty, and in-app engagement converge in this horizon. Alongside app share: AI-assisted conversion, member retention lift, AAU at 75% (1yr/2yr ratio), and the share of disruptions handled proactively.

Chapter 28 — 2030 Vision: Customer Account as the Relationship Platform

The end state

By 2030, Customer Account is understood as TUI's trusted relationship platform — the identity, consent, and understanding layer that every experience draws upon. Three things are true that were not true at the start.

The relationship is continuous, not episodic. A customer is recognised across every channel, their context available and current. The relationship spans the whole trip and beyond — from inspiration through in-resort and return. This is TUI's structural advantage over every marketplace and AI intermediary, fully realised.

Understanding is produced once and consumed everywhere. Identity, profile, preferences, and context are resolved to a single customer, exposed through reusable APIs, interpreted by a shared intelligence layer, and governed by consent that travels with the data.

Trust is the durable advantage. In an ecosystem where inventory is commoditised and capable AI is available to everyone, the trusted, consented, trip-spanning relationship survives — and it is what Customer Account holds.

Why this is achievable

None of it requires a new platform. The 2030 vision is the compounding result of the sequence: resolution enables reuse, reuse enables the companion, the companion enables the ecosystem role. Each horizon builds on Group Customer Account and the wider Sales Solutions platform.

Closing

Customer Account began as the place a customer logged in. It becomes the trusted relationship at the centre of TUI's digital business: the face the customer recognises, the memory that makes the relationship continuous, the consent that keeps it trusted, and the context that makes every experience genuinely personal.

Group Customer Account built the foundation. This strategy builds the relationship on top of it.

Chapter 29 — The Ask: Mobilisation and Sponsorship

Executive Summary

A strategy document should close by telling the reader what decision they are being asked to make. This chapter is that ask.

29.1 The decision

This strategy requests three things:

1. **A named executive sponsor** within Group Customer Account and Sales Solutions leadership who owns the strategic evolution described here — accountable for the relationship-platform outcome, not just the current-state operation.
2. **Cross-organisational commitment to identity resolution** as a funded FY27 priority, with architectural direction agreed across the CIAM layer, CDP, and marketing-technology estate. This is the single investment that gates the majority of the commercial value (Chapter 24).

3. **Alignment on the first consuming journey** for declared preferences by end of Q1 FY27 — a named journey owner committed to co-designing the integration, so that the first bet (Chapter 25) has a consumer before it has an API.

29.2 What we do Monday — Q1 FY27 mobilisation

Action	Owner	Timeline
Name executive sponsor for the relationship-platform evolution	GCA / Sales Solutions leadership	Week 1–2
Confirm first consuming journey for preferences (Search, Deals, or Post-Book ancillaries)	Product leadership + consuming journey PM	Q1 FY27
Secure resolution in the FY27 architecture roadmap with named architect	Architecture / Data Platform leadership	Q1 FY27
Stand up measurement baseline: recognised-vs-anonymous lift + AAU + logged-in % instrumentation	Customer Account + Analytics	Q1–Q2 FY27
Continue CIAM migration (Gigya → Ping) delivery per existing plan	CodingAces / Platform	Ongoing FY27
Initiate onboarding delivery for first additional entity (Airline or Sundeals)	CodingAces / Platform + Entity stakeholders	Q1 FY27
Align Loyalty enrolment paths with CodeArtisans for bookflow integration	CodingAces + CodeArtisans	Q1 FY27
Produce formal business case with validated assumptions (from Ch 24 ranges)	Sponsor + Customer Account PM	Q2 FY27
Share this strategy with GCA and Sales Solutions owners for alignment	Author (Albin Malmgren)	Immediate

29.3 Who needs to read this

This strategy is addressed to: - **Group Customer Account leadership** — as the capability owner - **Sales Solutions leadership** — as the vision owner (Concierge, personalisation, app strategy) - **Architecture and Data Platform** — as the resolution dependency owner - **Post-Book pod leadership** — as the delivery context

It has real value to TUI; the only thing standing between it and impact is that the right people read it, challenge it, and decide to act.

29.4 What success looks like in 12 months

By end of FY27, if this mobilisation succeeds: - One live journey consumes declared preferences with measurable lift - The resolution business case is quantified and funded for FY28 - The CIAM migration has delivered MFA and modern auth - Relationship metrics (not login metrics) govern the Account roadmap - Onboardings are live in at least one additional entity - Loyalty enrolment paths are enabled in the booking flow - Price alerts are live as an account-exclusive feature - An executive sponsor is accountable for the multi-year evolution

If this does not happen, the strategy remains a document. The window described in Chapter 3 does not wait.

Appendix A — Dependencies and Risks

This strategy is deliberately honest about what sits outside Customer Account's direct control. The dependencies below require cross-organisational investment; naming them openly is what keeps the strategy credible.

A.1 Cross-organisational dependencies

Dependency	Why it matters	Owning capability	Risk	Commercial impact if blocked
Identity resolution	The one technical dependency everything compounds on	Architecture and data platform	HIGH — requires prioritisation beyond Customer Account's own remit	Blocks €300m–€890m retention opportunity and €12m–€24m ancillary margin (Ch 24)
CDP unification	Context quality depends on unified customer history	Data platform	MEDIUM — in progress but not complete	Degrades context quality; partial value still achievable via declared data
A consuming journey for preferences	Reuse value depends on a consumer existing, not just an API	Journey and search product areas	MEDIUM — requires early alignment and a working integration	Preferences ship but prove nothing; no lift evidence for FY28 case
In-resort data integration	The trip-spanning context claim depends on hotel, cruise, and excursion data	Hotel, cruise, and destination technology	HIGH — multi-year, multi-estate integration	Trip-spanning companion cannot be realised; vertical-integration advantage unexpressed
Agent-identity standards	Delegation requires settled protocols	Industry (OAuth 2.1, MCP, eIDAS 2.0)	LOW — TUI can prepare the model while standards settle	Delay to agent-delegation deployment; low impact on FY27–28 value
Concierge vision funding	AI experiences depend on Concierge being committed	Sales Solutions leadership	MEDIUM — currently at vision/ discovery stage	Account capabilities retain independent value; compound impact delayed
TUI Studios	Potential adjacent initiative for content and experience creation; relationship to Account/Concierge TBC	Sales Solutions / Content leadership	LOW — Account strategy is not dependent on Studios, but alignment on customer-data consumption and content personalisation should be tracked as Studios' scope clarifies	No direct block; missed synergy if uncoordinated
Loyalty programme scaling	Account growth increasingly coupled to Loyalty growth (exclusive offers migration)	CodeArtisans / Loyalty ownership	MEDIUM — CodingAces enables but does not control programme decisions	Slower active-base growth if enrolment friction persists; Loyalty 5m/8m targets at risk

A.2 Key risks and mitigations

Risk	Impact	Mitigation
Identity resolution is not prioritised cross-organisationally	Full context read blocked; €300m–€890m retention opportunity unrealised	FY27 measurement baseline builds the quantified case; declared-data reuse proceeds independently
No journey consumes the Preferences API	The capability ships but proves nothing	Secure a consuming journey's commitment *before* build; co-design the integration
Agent standards do not stabilise	Delegation model built on wrong assumptions	Prepare the consent model abstractly; defer protocol-specific implementation
CIAM migration delays	MFA, modern auth, and Ping Protect capabilities arrive late	Migration has its own "Must" priority; this strategy does not add scope but benefits from delivery
The strategy is read as a delivery commitment for everything it describes	Disappointment when cross-organisational work does not land	Use this appendix to set expectations from the start: the strategy distinguishes what Customer Account establishes from what it depends on
Concierge vision remains unfunded	AI-experience payoff delayed	Account capabilities (reuse, retention, personalisation) have independent commercial value; the strategy works without Concierge, just more powerfully with it
Onboardings blocked by entity-specific technical debt	"One TUI Account & Hub" objective delayed; Loyalty enrolment in those entities blocked	Prioritise entities by data-readiness; accept phased rollout rather than big-bang
Exclusive-offers migration to Loyalty-exclusive erodes account growth lever	Active account growth slows if Loyalty enrolment is not frictionless	Ensure account value proposition (preferences, personalisation, convenience) stands independent of offer-gating; co-own enrolment friction with Loyalty team

Internal TUI corroboration

- TUI Sales Solutions — 3-Year Strategy Update (June 2026): AI research adoption (40–45%) and willingness to book via agentic channels (8–15%) within three years; 21% app-share goal by FY29; app-channel-shift value (~€1m from online, ~€8.7m from retail per point).
- TUI Sales Solutions — FY26 delivery data: rebooking 38.33% within 2 years; ABV €3,581; ancillary attach Book 50.9% / MMB 8.5%; App share 11.7% (+2.1ppt YoY).
- TUI Customer Account — FY27 strategic initiatives: auth-provider migration (Gigya → Ping) as "Must" priority; MFA activation; GAS legacy decommissioning; Onboardings; Loyalty enrolment enablement; AI authentication; Price Alerts.
- TUI Account Solutions — 3-Year Plan: Active Accounts (2yr) 15m → 17m → 19m → 21m (FY25–FY28, +12% CAGR); AAU target 75% by FY29, 80% by FY30; Loyalty enrolment 1m → 5m → 8m (FY26–FY28).
- TUI Loyalty Solutions — 3-Year Plan: four objectives (Launch, Build Base, Engage, Personalise in App); exclusive-offers migration to Loyalty-exclusive; TUI Card integration; reward non-transactional engagement.

Changelog: v4 → v5

Change	Section(s) affected	Rationale
Corrected active-account base from ~5.5m to 17m (FY26); rebased all commercial sizing	Exec Summary, Ch 16.3, Ch 24.2	v4 used an unverified subset figure; Account Solutions 3YP confirms 17m active accounts (2yr) in FY26, growing to 21m by FY28 at +12% CAGR
Added full 3YP active-account projection table (FY25–FY30) and AAU metric	Ch 24.2	Anchors the commercial case to the validated plan rather than estimates
Added Onboardings (Airline, Sundeals, TUI Iberia) as named "Must" FY27 workstream	Ch 25	Confirmed "Must" initiative in the GCA plan; prerequisite for One TUI Account & Hub and Loyalty scaling
Added Price Alerts on Shortlist as "Should" FY27 bet	Ch 25	GCA plan lists as high-value (CVR/MAU) initiative; does not depend on identity resolution; strengthens "encourage early login"

Change	Section(s) affected	Rationale
Expanded Ch 13 (Rewards) with Loyalty 3YP objectives, enrolment forecasts, and exclusive-offers migration	Ch 13	Loyalty Solutions 3YP shows four objectives and 1m→5m→8m member trajectory tightly coupled to Account
Added frictionless Loyalty enrolment enablement as shared "Must" in FY27	Ch 25	GCA plan marks as "Must / H – Sign ups"; CodingAces enables the identity path
Added AAU (1yr active % of 2yr) and Logged-in % to measurement framework	Ch 22, Ch 25	GCA plan key results; missing from v4's proposed metric set
Added logged-in experience optimisation as initiative feeding measurement baseline	Ch 22, Ch 25	GCA plan "Should" initiative; produces the recognised-vs-anonymous evidence
Added Sharing of bookings and shortlist to FY28 horizon	Ch 26	GCA plan "Should" initiative (H – sign ups / active accounts / MAU)
Added Preferences & personalisation centre maturity to FY29	Ch 27	GCA plan "Should" initiative (M – NPS); fits FY29 companion theme
Acknowledged TUI Studios in Appendix A dependencies	Appendix A	Recurring "Concierge & TUI Studios?" question in GCA plan; relationship TBC but alignment should be tracked
Added Loyalty programme scaling as dependency	Appendix A	Exclusive-offers → Loyalty-exclusive shift couples Account growth to Loyalty friction
Added onboardings risk to Appendix A	Appendix A	Entity-specific technical debt may block rollout
Updated Internal TUI corroboration references	References	Added Account Solutions 3YP data and Loyalty Solutions 3YP data
Updated Ch 29 mobilisation table with onboardings, Loyalty alignment, and AAU instrumentation	Ch 29	Reflecting the expanded FY27 scope from the validated plan
Rebased total addressable value from €130m–€340m to €330m–€940m	Ch 24.3	Consequence of corrected base (17m vs 5.5m)

Changelog: v3 → v4

Change	Section(s) affected	Rationale
Removed third-party cookie deprecation as primary driver; replaced with privacy regulation + platform signal loss + AI channel fragmentation	Ch 2.1	Google reversed Privacy Sandbox deprecation in 2025; the first-party conclusion holds but needed re-anchoring on real drivers
Acknowledged Gigya → Ping migration throughout; reframed from "Gigya is the anchor" to "the capability is the anchor"	Ch 5.2, 5.4, 6, 16, 17	Live FY27 migration was unacknowledged; addressing it strengthens the capability argument
Softened or removed unverified platform names (Tealium, Next.js, USL, Customer Profile APIs)	Ch 5.2, 20	Could not be sourced to a standard the document should assert; replaced with capability descriptions

Change	Section(s) affected	Rationale
Replaced "One Account" with "Group Customer Account" / "One TUI Account" / "1web myTUI hub"	Throughout	Aligning to internal vocabulary used by capability owners
Changed "Concierge" references to "the Concierge vision" with maturity caveat	Exec Summary, Ch 15, 27, Appendix A	Concierge is vision/discovery stage, not a committed funded programme
Softened eIDAS 2.0 and PSD2 claims	Ch 15, 17	eIDAS: "near-term legal reality, early practical maturity"; PSD2: analogy, not extension
Added Chapter 24: Sizing the Prize (commercial value model)	Part V, new chapter	Reviewer feedback: the strategy claimed CLV/ retention/margin uplift but never sized them
Elevated identity resolution with commercial quantification	Ch 16.3	Reviewer feedback: the gating dependency should be the sharpest, most quantified section
Led with vertical-integration differentiator more prominently	Exec Summary, Ch 1.2, 2.2, 3.3, 27, 28	Reviewer feedback: TUI's strongest unique claim was buried; now leads the argument
Added Chapter 29: The Ask (mobilisation, sponsorship, Monday actions)	Part V, new chapter	Reviewer feedback: strategy should close with an explicit decision request
Added privacy-regulation references section	References	Supporting the re-anchored Ch 2.1 argument
Added commercial-impact column to Appendix A dependencies	Appendix A	Connecting risks to the value model
